

Overview

Probes have been launched again, with the same safety parameters and an exploration depth of six. We await their results eagerly.

We have completed our scanning of the solar system and present the results in this report.

Solar System

We have detected emissions from a number of known sources (which we used to calibrate our equipment) and a few unknown sources.

Known Presence

High earth orbit (beyond the moon): 'Ad Astra' space station. Our official contact with the Narxbloche.

Low earth orbit (including geocentric) Numerous satellite constellations, including the ineffectual 'Star Wars' missile defence shield.

Asteroid belt: Us, of course – and several ringer vessels.

Far out – the two known jump points.

We were also able to detect the expected contingent of planets and moons. Astronomical data is beng shared with scientists back on earth.

Unexpected Presence

There's a lot of activity of some sort going on around Callisto. Some of it looks like ship engines, some of it doesn't.

There's large regular pulses coming from what appear to be fixed installations 'near' the jump points. We assume this to be the Narxbloche scanning.

There also appears to be some emissions way out beyond the Oort cloud. Studies continue here.
